

BUSINESS AND GROUP PORTALS

OodelCX Volume A: Customer X

How to collect customer feedback, turn it into owned cases, and prove the fix worked.

Volume A · October 2026

Written from the application code on the `main` branch. No screenshots are used.

Contents

1. How to read this volume — who is who
2. 1. Getting started — account, login, menu
3. 2. Capture — surveys, QR, drafts, responses
4. 3. Clarify — analytics, insights, highlights, value
5. 4. Claim — cases, escalation, alerts
6. 5. Close — decision log, initiatives, reply to customer
7. 6. Confirm — CX Pulse, Compass, Evidence Fusion, REACH
8. 7. The Group portal — branches and central surveys
9. 8. Billing, support, security —
10. 9. Quick reference — what you do and what OodelCX does

How to read this volume

This is Volume A of three guides to OodelCX. It explains, in plain English and in the order you will meet it, what a customer of OodelCX sees and does with **Customer X**: the product that collects feedback from your customers and turns it into action. Volume B covers Colleague X (feedback from your own people). Volume C is the internal manual for the OodelCX team.

Everything here describes what the product does today, taken from the application code. Where something is done for you by the OodelCX team (creating your account, adding team members, setting your plan and prices), the guide says so, because you cannot do it yourself in the portal. Each feature is described the same way: the problem it solves, where to find it, how to use it, and what happens next.

The two portals

PORTAL	WHO USES IT	WHAT IT IS
Business portal	One business: a restaurant, clinic, school or bank branch	Everything for one location: surveys, responses, cases, insights and settings.
Parent Organisation portal (Group portal)	A company with several businesses, such as a bank with many branches	A view across every branch, plus the controls that decide what each branch may do.

A business that belongs to a group is called a **branch**. It uses the same Business portal as a stand-alone business, with a note that it is part of the group, and some pages are controlled by the group. It is one portal with conditional pages, not a separate product.

Who is who

PERSON	WHAT THEY ARE	NOTES
Owner	The primary login for a business or a group	Created by OodelCX. Only the owner sees Billing and Escalation hierarchy.
Full team member	A colleague with their own login	Sees every page the owner sees except owner-only ones, minus any pages OodelCX has switched off for that person.
Limited team member	A colleague who only works cases	Sees one page, My Cases, and only cases assigned to them.
Respondent	The customer who answers a survey	Not a user. They scan a QR code or open a link. They never log in.
OodelCX team	Staff who run the platform	Create accounts, set plans and prices, add team members, approve AI reports, build default question templates.

Customer X and Colleague X in one account

An account can have Customer X, Colleague X or both. With both, a switch at the top of the menu flips between them. This volume describes the Customer X side. A **branch** of a group sees Customer X only: staff feedback is a head-office matter (see Volume B).

1. Getting started

Your account, your login and the portal tour

Problem solved. A new customer should go from 'we signed up' to 'I am looking at my own dashboard' without a training session and without anyone sharing a password.

Where. Admin creates the account; you receive an email.

How to use it.

1. OodelCX creates your business or group in the Admin portal, chooses your products and plan, and adds your owner login. You do nothing for this step.
2. The owner receives a welcome email with a link to set a password. Team members receive an invitation email. The link works once and expires after 7 days; ask OodelCX to resend it if it has expired.
3. Go to the login page, enter your email and password and sign in. You are sent to the right portal automatically.
4. Optional: switch on two-factor sign-in under **Security**. Scan the QR code with an authenticator app and type the six-digit code. Switching it off asks for your password.

What happens next. You land on the dashboard. The menu on the left is arranged as a journey (see the next section).

The menu is a journey

The Business portal menu follows the OodelCX loop, from setting up to proving results. Group names are approximate; the page names are exact.

MENU GROUP	WHAT IS IN IT
Top of the menu	My Cases (limited members), Dashboard, OodelCX Compass
Setup	Feedback Points, Category Owners
Capture	Raw Feedback
Clarify	Insights, Highlights, Analytics and the measurement pages
Claim	Alert Rules, Alerts, Attention Centre, Case Management
Close	Improvement Initiatives, Decision Log
Confirm	CX Pulse and CX and EX correlation
Admin	Team Members, Support, Billing, Escalation hierarchy, Playbook Library, Security

The group portal has the same shape with extra pages: Overview, Command Center, Branches, Compare branches and Team and access. A page that does not apply to you, or that your group or OodelCX has switched off, does not appear.

2. Capture: surveys, QR codes and links

Build a survey (Feedback Points)

Problem solved. Feedback is only useful if it is collected at the right moment, in a few seconds, with questions you chose.

Where. Setup > Feedback Points.

How to use it.

1. Press build a survey. Give it a name and an optional description.
2. Pick questions. You can start from an OodelCX template or write your own. Nine question types are available: star rating, NPS (0 to 10), CES (effort), yes/no, dropdown, multiple choice, open text and more.
3. Choose how it is delivered: QR code, link or both. Choose the layout: all questions on one screen, or one question per screen.
4. Optional: set a response quota. The survey closes by itself when the quota is reached. You can also set start and end dates, or tie it to an event.
5. Press **Publish** to start collecting, or **Save as draft** to keep it for later.

What happens next. A feedback point is created with its own link and QR code, even in draft.

Draft, Live and Closed

Problem solved. You often want a survey ready before it should collect answers, and you need to stop one cleanly when the event is over.

Where. Setup > Feedback Points.

How to use it.

1. A **Draft** survey has a link and QR code but refuses answers. The form tells the respondent it is not collecting yet.
2. Press **Publish** to make it **Live**.
3. Press **Close** to stop collecting. The link then refuses answers. Press **Reopen** to start again.
4. Click the response count on any survey to open Raw Feedback filtered to that survey.

What happens next. Nothing is deleted when a survey is closed. All its responses stay.

A branch of a group does not build or publish surveys. The group does that centrally, so surveys stay consistent across the network.

The public form your customers see

Problem solved. Customers should answer in under a minute, on their own phone, with no app and no account.

Where. The link or QR code you share.

How to use it.

1. The respondent scans the QR code or opens the link.

2. They answer each question. Name, email and phone fields are always shown. Email is optional and the form invites an address if they would like a reply. Age and gender follow the survey's setting.
3. They press Send and see a thank-you.

What happens next. The answer is saved and scored immediately. Very low answers can open a case (see section 4).

QR codes and printable posters

Problem solved. The survey has to be physically present where service happens.

Where. Feedback Points > the QR button on a survey.

How to use it.

1. Open the QR dialog to see and download the code.
2. Open the poster page to print a ready-made poster with the code.

What happens next. Each feedback point has its own code, so you can compare locations or moments.

Raw Feedback

Problem solved. You need to read what customers actually wrote, not only averages.

Where. Capture > Raw Feedback.

How to use it.

1. Open the list. Filter by date and by survey.
2. Open any response to see every answer, the respondent's details and any case already opened for it.
3. Press **Make this a case** on any response to open a case by hand.

What happens next. A case opened by hand shows your email as the person who raised it.

3. Clarify: understand what came in

PAGE	WHAT IT SHOWS
Analytics	CSAT, CES and NPS, trends against earlier periods, scores by category, drivers (which categories move the overall score) and themes in open comments. Choose the period at the top.
Insights	AI-written reports on a schedule. Reports are drafted by the system and shown to you only after the OodelCX team has approved them.
Highlights	The other side of feedback: strong positive comments and recurring positive themes from the last 90 days, ready to share with the team.
Business Value	Using figures you enter (average spend, visits per year and similar), an estimate of the value at stake in unresolved negative feedback and the value of what has been resolved. Nothing is read from an accounting system.
Program Evaluation	For a training programme or event: enter its aims and expected outcomes, and the page compares them with the feedback received, showing where they match and where they do not.
CX and EX correlation	Where both products are used, whether colleague sentiment at a location moves with customer sentiment. It needs enough responses on both sides.

Scores that rest on very few responses are labelled with a confidence level, so a single answer is never mistaken for a trend.

4. Claim: cases, owners and alerts

How cases are created

Problem solved. A problem nobody owns is a problem nobody fixes.

Where. Claim > Case Management.

How to use it.

1. **Automatically from a very low response.** A response averaging one star or less, or an NPS of 2 or less, opens a case with an owner and due date. At most five automatic cases are opened per location per day, so a bad afternoon cannot flood the list.
2. **By hand.** Press Make this a case on any response, or add a case from Case Management.
3. **From a recurring issue.** When the same issue keeps coming back, a flag offers to turn it into an initiative.

What happens next. Each case has a priority, a category, an owner and a due date.

Working a case

Problem solved. Owners need one place to see the history and act.

Where. Claim > Case Management, then open a case.

How to use it.

1. Open the case. The top shows **Raised by** (a person or the system) and the timeline of every change.
2. Change the status, assign an owner, set a due date, add comments.
3. If a playbook applies to the category, its checklist appears and each step can be ticked.
4. If the respondent left an email, send them a reply from the case. The reply is recorded on the timeline. With no email, the page tells you why.
5. Resolve the case with a note describing what was done.

What happens next. A resolved case creates a draft entry in the Decision Log for someone to confirm.

Escalation

Problem solved. A case that is stuck needs to reach someone with the authority to move it, and everyone should be able to see how it got there.

Where. Claim > Case Management; the chain is set under Admin > Escalation hierarchy.

How to use it.

1. Press **Escalate**. One button, not several.
2. A panel shows the level the case is at, the level it will go to, who holds that level and that they will be emailed. Add a note if you wish and confirm.
3. A banner confirms who now has the case. The card shows the new owner and level. At the top level the button is replaced by 'Highest level reached'.
4. Press **Step back** to return the case one level. This never deletes anything.

5. If a time limit is set, a case that has not moved is escalated automatically (needs the scheduled job; see Volume C).

What happens next. Every move is kept for good: who pressed the button, who received the case and at which level. A senior person opening the case can see who originally raised it and every hand it passed through.

The chain itself (the levels and who holds each) is set up by the owner or the group, not by case workers.

Alert rules

Problem solved. You should hear about a drop when it happens, not at the end of the month.

Where. Claim > Alert Rules (owner only; a branch only if its group allows it).

How to use it.

1. Add a rule. Choose the kind: score decline, sudden drop, outlier branch or NPS floor, and the limit.
2. Choose who is emailed.

What happens next. When a rule fires, an email goes to the chosen person. The rule does not create a case by itself. A rule will not email again for the same rule within an hour.

Alert emails need email sending to be set up by OodeICX.

PAGE	WHAT IT IS FOR
Attention Centre	Items that need action now, grouped by kind (overdue, close to an escalation limit, waiting for a customer reply), each linking to its case.
Alerts	A list of alerts that have fired.
Category Owners	Who owns each category by default. Cases in a category go to its owner. In a group the default is set centrally and a branch may override it only if allowed.
Playbook Library	Agreed responses to recurring issues, as checklists. They attach to a case automatically when their category matches.

5. Close: proving it worked

PAGE	WHAT IT IS FOR
Decision Log	A record of what was changed, why, who owns it and the result. When enough time and new feedback have passed, the system measures the score before and after and labels how much data sits behind the result. Entries drafted automatically from resolved cases say they need confirming.
Improvement Initiatives	Work bigger than one case. Each initiative has an owner, notes and a status and links to the cases behind it. Open a card to see it in a drawer.
Closing the Loop (customer)	Where a respondent left an email, reply to them about their case from the case page. The reply is recorded on the timeline.

6. Confirm: CX Pulse and Compass

CX Pulse

Problem solved. Averages say how customers feel. CX Pulse says how well your organisation is handling what they tell you.

Where. Confirm > CX Pulse.

How to use it.

1. Open CX Pulse to see a single score, its five parts (awareness, response speed, ownership, culture and measured outcomes), a ladder showing your level and the trend.
2. Read the line **What would move you up** under the heading. It names your weakest Compass area and links to its recommendation. If you have not taken Compass, it links to the assessment.

What happens next. The score is recomputed by a scheduled job. In a group, the group sees every branch's score and which branches are held back.

OodelCX Compass: ANCHOR, Evidence Fusion and REACH

Problem solved. A business needs to know how it really runs experience management, and what to do about the gaps.

Where. OodelCX Compass, near the top of the menu.

How to use it.

1. **ANCHOR** is the framework: six areas (Authority, Numbers, Culture, Hearing, Ownership, Rhythm). Take the assessment: answer a short question for each area on a four-step ladder (Absent, Ad hoc, Defined, Embedded). Each area is scored on its weakest answer, and one weak area keeps the whole account at **Emerging** instead of **Established**.
2. **Evidence Fusion** then checks each self-score against three real signals from your account, such as whether cases have owners or decisions are logged. Each area is tagged confirmed, overstated, understated or not enough data.
3. **REACH** turns every weak or overstated area into a card with five parts: Recognize (the gap in plain words), Elevate (email a colleague who can act), Align (a suggested goal), Connect (a link to the screen that fixes it) and Habituate (a routine to build).
4. Retake the assessment when it is due. History shows how you have moved over time.

What happens next. The questions are the same for every client and are set by OodelCX. Your answers and results are your own.

The recommendation wording can be edited by OodelCX under Admin > Tooltips.

7. The Group portal

A group sees everything a branch sees, rolled up, plus pages only a group can use.

PAGE	WHAT IT IS FOR
Overview	Network totals, branches needing attention and what is holding the network back.
Command Center	One screen of every branch's health, with open and overdue cases.
Branches and Compare branches	Each branch's score, rank, trend and response count, side by side. Click a branch to open it.
Regions	Branches grouped by region.
Feedback Points	The group builds surveys once and chooses which branches get them (all are ticked by default). Each branch gets its own link and QR code.
Team and access	Team members, and which pages each may open. Adding or inviting people is done by OodeICX.
Branch permissions	Which areas a branch may manage itself (for example alert rules or goals). Anything switched off is refused by the server, not only hidden.
Category Owners and Escalation hierarchy	Defaults for every branch.

Publishing one survey to many branches

Problem solved. Every branch building its own survey leaves you with answers that cannot be compared.

Where. Group portal > Feedback Points > build a survey.

How to use it.

1. Build the survey as usual.
2. Tick the branches that should get it. All are ticked by default.
3. Press Publish or Save as draft.

What happens next. One feedback point is created for each ticked branch, each with its own link and QR code. A branch that cannot take another point is named in the message.

8. Billing, support and security

PAGE	WHAT IT IS FOR
Billing	Your plan and what you pay. Press the checkout button to pay. If a checkout is already open you are taken back to the same one, so you cannot be charged twice by a double click. A failed payment shows a banner.
Support	Send a question or problem to OodelCX and follow its status.
Security	Two-factor sign-in and your password.
Team Members	See your team. OodelCX adds or removes members and sets per-person page access.

9. Quick reference: what you can and cannot do yourself

YOU CAN	OODELCX DOES IT FOR YOU
Build, publish, close surveys (business owners)	Create your account, plan and prices
Work cases, escalate, step back	Add or remove team members
Set alert rules, category owners, escalation chain (owners)	Approve AI Insights reports
Take Compass, read REACH cards	Edit Compass questions and recommendation wording
Enter Business Value figures	Switch features on or off for your account

Honest limits. Some features need setup on the OodelCX side before they work for you: email for alerts and replies, the scheduled jobs for escalation timers, Pulse updates and weekly Insights, and the AI service for reports. If one of these is not working, tell your OodelCX contact; Admin > Platform Health shows what is missing.
