

FOR THE OODELCX TEAM (ADMIN)

OodelCX Volume C: Team Manual

How to create and run accounts, approve what customers see, and keep the platform healthy.

Volume C · October 2026

Written from the application code on the `main` branch. No screenshots are used.

Contents

1. How to read this manual — roles
2. 1. The Admin portal tour —
3. 2. Accounts — create, team, features, escalation, pricing
4. 3. Survey set-up —
5. 4. Content, email and the website —
6. 5. AI Insights Queue —
7. 6. Support, billing oversight and health —
8. 7. Compass and CX Pulse administration —
9. 8. Running the platform — settings, jobs, Stripe, demo data
10. 9. Runbook —
11. 10. Not built, or dropped on purpose —

How to read this manual

This manual is for the OodelCX team. It describes what the Admin portal and the platform do today, written from the application's code. It does not cover features that were considered and dropped; those are listed once at the end. OodelCX sells two products: **Customer X** (feedback from a business's customers by QR code or link) and **Colleague X** (feedback from a business's own staff). An account can have either or both.

Who is who

PERSON	WHERE THEY LOG IN	WHAT THEY DO
OodelCX Admin (staff)	Admin portal	Creates and runs every account, sets pricing, approves AI reports, edits the website.
Account manager (staff)	Admin portal	Looks after an assigned set of accounts and their AI report queue.
Finance (staff)	Admin portal	Sees billing and money, not customer feedback.
Group owner	Group portal	Runs several businesses (branches) together.
Business owner	Business portal	Runs one business or one branch.
Team member	Business or Group portal	A person OodelCX has added, with per-person page access.
Respondent	A survey link, no login	A customer or colleague answering a survey.

The three built-in staff roles

Roles decide which Admin areas a person can use. Each area has View, Edit and Delete switches, and two areas also carry a scope: all accounts or only assigned accounts. A user with Staff and roles access can add custom roles.

AREA	ADMIN	ACCOUNT MANAGER	FINANCE
Businesses and Parent Organisations	View, edit, delete, all	View, edit, assigned only	View only, all
Staff and roles	Full	None	None
Billing Oversight	Full	None	View and edit
Question Templates	Full	View only	None
Email and Site Content	Full	None	None
AI Insights Queue	Full, all	View and edit, assigned only	None

Finance can see the whole account record on Businesses and Parent Organisations, because the account list does not trim fields by role today.

1. The Admin portal tour

MENU ITEM	WHAT IT IS FOR
Overview	Headline numbers (accounts, MRR, AI reports pending) and a needs-attention list.
Command Center	Every client's health on one screen: scores, open and overdue cases, Pulse level mix, billing counts, top movers.
Accounts	Four tabs: Businesses, Parent Organizations, Staff, Roles. Also holds the platform-wide payment gate switch.
Question Templates, Categories, Industries	Survey set-up: reusable question sets, the topic tags on questions, and the list behind every industry dropdown.
Email Templates	The wording of every system email.
Site CMS, Content Settings, Tooltips	Every word on the public site, the tab title, the guided tour, and the info-tip and recommendation wording inside the portals.
Contact Messages	Demo requests and contact form messages.
Support Queue	Tickets customers send from their portal, including feedback point requests.
AI Insights Queue	Reports drafted by the system waiting for approval.
Alert Rules	Read-only view of clients' rules.
Billing Oversight	Subscriptions, payments and finance views.
CX Pulse	The Pulse framework settings.
Compass Questions	The assessment questions, their order and which product each applies to; and the retake cadence.
Sector Benchmarks	Opt-in, anonymised comparison across businesses in an industry.
Platform Health	Failed webhooks, billing syncs and scheduled jobs; accounts stuck onboarding; the setup checklist; the scheduled job table.
Audit Log	Who changed what for sensitive actions.
Security	Your own password and two-factor sign-in.
Dev Data Tools	Seed demo data, add the launch demo layer, recompute, wipe. Only when enabled for the environment.

2. Accounts

Create a business or a group

Problem solved. Every customer starts here; customers cannot sign themselves up.

Where. Accounts > Businesses or Parent Organizations > Add.

How to use it.

1. Enter the name, industry and region. Choose the products (Customer X, Colleague X or both).
2. For a branch, choose its parent group. For a stand-alone business, leave it empty.
3. Set the plan limits: the number of feedback points and team seats.
4. Set pricing for the account (see Pricing below) and who pays: the group or the branch.
5. Enter the owner's email. The owner receives a welcome email to set a password.

What happens next. Status on the list shows invite pending until the owner sets a password, then active. You can resend the invite from the list. An invitation expires after 7 days.

Team members

Problem solved. Customers cannot invite people themselves; this keeps seat limits and access under your control.

Where. Open an account > Team tab.

How to use it.

1. Add a member with their email, a tier (full or limited) and a role label.
2. Switch off any pages that person should not open. A full member sees everything except the pages you restrict.
3. Seat limits are enforced when you add.

What happens next. The member receives an invitation email. Page restrictions are enforced by the server, not only in the menu.

Feature switches

Problem solved. A lower plan or a pilot should not see every advanced feature.

Where. Open an account > Features.

How to use it.

1. Tick the features this account may use: Insights, Analytics, Alert Rules, Reports, Improvement Initiatives, Decision Log, CX Pulse, Playbook Library, Closing the Loop, Business Value, OodeICX Compass, Highlights and Program Evaluation.
2. Save. The matching pages disappear from the customer's menu and their APIs refuse access.

What happens next. Core pages (Feedback Points, Raw Feedback, Case Management, Team Members, Billing, Security, Support) are never gated.

An account saved before switches existed has everything on until you edit it. The Closing the Loop switch also controls the customer reply from a case.

Escalation workflow

Problem solved. Cases need a chain of people to move up.

Where. Open an account > Escalation.

How to use it.

1. Define the levels (level 1 is always the branch owner) and the time allowed at each level.
2. Assign the person who holds each level above 1: for a branch, a branch-specific person, a regional person or an organisation-wide person (checked in that order).

What happens next. Customers then see who will receive a case before they escalate. A level with nobody assigned moves the case up but notifies no one; the screen warns about this.

Pricing and billing

Problem solved. Each customer can have a different price, and the charge must follow who pays.

Where. Open an account > Billing or Pricing.

How to use it.

1. Set the price per product and the billing type (annual lump sum or recurring monthly). Both products on one account must use the same type.
2. Press Save price. The price is pushed to Stripe for you.
3. Choose who pays for each branch: the group or the branch.
4. Use the payment gate switch on Accounts to stop access for unpaid accounts when you want to.

What happens next. The customer pays from their Billing page. Checkout reuses an already-open Stripe session, and each Stripe event is handled once, so a double click or a repeated event cannot charge twice.

Deleting a business or group also removes its related records, so nothing is left orphaned. Ask before deleting a live account.

3. Survey set-up

PAGE	WHAT YOU DO THERE
Question Templates	Build reusable question sets. Nine question types. Customers can start from a template and edit their own copy.
Categories	Topic tags attached to questions, per product. Categories drive scores, owners and case routing. A category can no longer be marked sensitive; existing ones can only be switched off.
Industries	The list behind every industry dropdown. Add a new industry by name at any time.

Demographic questions (age and gender) are controlled per survey. For Colleague X they default to off.

4. Content, email and the website

PAGE	WHAT YOU DO THERE
Email Templates	Edit the subject and body of every system email. Each template lists the merge fields it can use. The 'Compass recommendation' email is sent when someone presses Send by email on a REACH card. If a template is missing from the database, the shipped default is used.
Site CMS	Edit every line of the public pages, the menu and the footer, including which menu items are visible. Hiding Pricing hides its pages and any button that points to it.
Tooltips	Info-tip text and the Compass recommendation wording, per screen.
Content Settings	Browser tab title, the CX Pulse ladder sub-text and the guided tour switch.
Contact Messages	Messages and demo requests from the public site.

Copy revision. The site's stored wording is rewritten from the shipped copy when the copy revision number changes (it was raised for launch). Edits you made in Site CMS on pages covered by that rewrite are replaced the first time the site loads after a deploy. After that, edits are kept.

5. AI Insights Queue

Approving reports

Problem solved. Nothing the AI writes should reach a customer unreviewed.

Where. AI Insights Queue.

How to use it.

1. A scheduled job drafts reports for each account, per product (needs the AI key).
2. Open a report, edit the text, choose whether its chart shows on the customer's dashboard.
3. Approve it. Only then does the customer see it.

What happens next. Account managers see only the queue for their assigned accounts.

6. Support, billing oversight and health

PAGE	WHAT YOU DO THERE
Support Queue	Open tickets by status (open, in progress, resolved). Customer requests for a new feedback point arrive here too. A new ticket notifies the team by email.
Billing Oversight	See every subscription, its status and payment method, and finance totals.
Platform Health	See failed Stripe webhooks, billing syncs and scheduled jobs; see accounts stuck mid-onboarding; read the setup checklist and the scheduled job table (section 8).
Audit Log	A record of sensitive changes: who, what and when.
Sector Benchmarks	Customers opt in to have anonymised scores included in sector reports.

7. Compass and CX Pulse administration

Compass questions

Problem solved. One shared question bank keeps every client's results comparable.

Where. Admin > Compass Questions.

How to use it.

1. Edit a question's wording, order and variant: shared (asked of everyone), customer-only or staff-only.
2. Set how often clients must retake (the cadence).

What happens next. A change applies from the next assessment. Past answers are not touched. The six areas (Authority, Numbers, Culture, Hearing, Ownership, Rhythm), the four-step ladder and the scoring rule are fixed.

Question wording is not tailored by industry; the same questions go to every client.

REACH text. Each recommendation (the gap sentence, who to ask, the suggested goal and the routine) can be edited under Tooltips > Compass recommendations. **Evidence Fusion** needs no set-up: it reads each client's own activity.

CX Pulse. The framework screen holds the dimension weights and ladder wording. Pulse is recomputed by the daily job.

8. Running the platform

Branches and deploys

All work lands on `main`. The `production` branch is what customers use; pushing to it is a live deploy. Match production to main only on an explicit decision, after testing on staging.

Environment settings (Render)

SETTING	WHAT IT DOES	IF MISSING
MONGODB_URI	The database connection	Nothing works
RESEND_API_KEY and RESEND_FROM_EMAIL	Sends every email from a verified domain	No invites, alerts, replies or recommendations are emailed
ANTHROPIC_API_KEY	AI Insights, themes, root cause, Program Evaluation	AI features do nothing
CRON_SECRET	Authorises the scheduled jobs	Jobs refuse to run
STRIPE_SECRET_KEY, STRIPE_WEBHOOK_SECRET	Billing and its webhook	Checkout or payment confirmation fails
APP_URL	The site's address in email links	Links in emails are wrong
ENABLE_DEV_DATA_TOOLS	Shows seed and wipe tools	Keep it off in production

Admin > Platform Health shows each of these as Set or Missing. It never shows the values.

Scheduled jobs

Create each as a Render Cron Job that sends a POST to `/api/cron/<job>` with the header `x-cron-secret` set to the secret. Platform Health shows when each last ran. A job that never ran means its feature is off in practice.

JOB	HOW OFTEN	WHAT STOPS WORKING WITHOUT IT
auto-escalate-cases	Hourly	Cases do not move up on their own
recompute-cx-pulse	Daily	CX Pulse goes stale
measure-decisions	Daily	Decision Log before/after is never measured
evaluate-baseline-alerts	Daily	Sudden-drop and outlier alerts, recurring-issue flags
generate-insights	Weekly	No AI Insights reports are drafted
program-evaluation	Daily	Program Evaluation is not refreshed
comp-expiry-reminders	Daily	Pilot and complimentary accounts get no expiry reminders

Stripe

Register `/api/webhooks/stripe` in the Stripe dashboard and set the signing secret. Test with Stripe test mode and the card 4242 4242 4242 4242 before going live.

Demo data

On staging, Dev Data Tools offers: **Seed showcase data** (the full demo for prospects: groups, branches, stand-alone businesses, cases, Compass history, Evidence Fusion and REACH data), **Add launch demo layer** (safe to repeat; adds escalation journeys with originators, draft and closed surveys, a staff survey per branch with response counts above and below five, and contact messages), **Recompute** and **Wipe all data**. Never press Wipe without a plan and a decision. Showcase logins are listed in DEMO-ACCOUNTS.md.

9. Runbook: when a client says something is wrong

THE CLIENT SAYS	CHECK FIRST	LIKELY CAUSE
I did not get an invitation	Accounts list: invite status; Platform Health setup checklist	Email not set up, or the 7-day link expired: resend
Alerts or replies are not arriving	Platform Health: email Set?	Missing email key or unverified domain
Cases never escalate by themselves	Platform Health: auto-escalate-cases	Job not set up, or no levels or time limit configured
Insights are empty	AI Insights Queue; Platform Health: generate-insights	Job not set up, AI key missing, or reports awaiting approval
A page is missing from my menu	Account Features; the person's restricted pages	Feature switched off, or access restricted for that person
A branch cannot see staff answers	By design	Staff pages are head-office only
A payment failed	Billing Oversight; Stripe dashboard	Card declined; the customer sees a banner
Compass results look wrong	Compass Questions; the account's activity	Evidence Fusion flags overstated areas on purpose

10. Not built, or dropped on purpose

ITEM	STATUS
Ask OodelCX (plain-English questions)	Later
1BYTE (spoken briefings)	Later
External feedback sources and integrations	Later
Single sign-on	Later
Staff lists, personal staff links, onboarding and exit surveys, staff cases and staff emails	Dropped
Sensitive-category routing to a confidential contact	Dropped
